

AbstractImprovements in and relating to a user interface for a radiotelephone

- 5 A user interface for a radiotelephone 1 is described in which the user is able to select components from a variety of sources including multimedia sources and the Internet. The user is then able to combine the components in a message and furthermore edit them to add expression to the message and to set delivery conditions for the message. The message may be archived for
- 10 later use or immediately sent to a third party either separately or as an attachment to another file.
